Dear [REDACTED],

The US EPA is considering convening an international workshop to bring together governmental entities that are engaging in development of higher throughput hazard and risk assessment methods and approaches in their chemical evaluation activities. It is well recognized that current practices are inadequate to address the numbers of chemicals that need to be assessed for safety and we are aware of a number of governmental entities that are working on accelerated and higher-throughput solutions involving both traditional data as well as emerging novel data streams. The purpose of the workshop would be to share legislative/regulatory drivers, current and evolving assessment approaches, chemical space coverage and major successes and barriers. This invitation-only workshop would be held over a two day period in September 2016 in the Washington, DC area. We would anticipate that each invited organization would bring 2-3 managers and practitioners who could engage in frank discussions that could result in a collection of lessons learned, best practices, data gaps, and potential collaboration or coordination opportunities being identified. We are hoping to keep the attendance to less than 50 participants for productive discussions.

We are reaching out to organizations in North America, Australia, Europe and Asia in hopes of getting a wide range of drivers and approaches. Before broadly announcing a workshop, however, we wanted to seek your opinion as to whether you agree such an event would be useful, and if so, if you have suggestions for other regulatory bodies who we should consider inviting to such a workshop.

Thanks for your interest and don't hesitate to contact me with questions.
